

POST TRANSPLANT DIABETES MELLITUS [PTDM]

DR SNEHA SIMON

DR VILESH VALSALAN

EXTRACORPOREAL NEPHROLOGY GROUP [ECNG]

INTRODUCTION

- 15-20% of non diabetic kidney transplant_recipients develop PTDM by 6 months.
- **PTDM** - Includes all post transplant diabetes first recognised after transplant regardless of prediabetic pre transplant, but excludes transient post-transplant hyperglycemia in 1st 6 week post transplant.
- HbA1c should **not** be used for **3 month** post Tx (False low HbA1c levels due to anaemia (erythropoietin treatment or blood cell transfusions)).
- Fasting glucose has a low sensitivity for diagnosing PTDM.
- **OGTT** is considered **gold standard** for diagnosis of PTDM and for screening preTx (2024 international consensus).

Time posttransplantation (days)		
Day 0-45	Day 46-365	> 365 days
ROUTINE BLOOD TESTS Presence of hyperglycemia (Do not diagnose as PTDM)	SCREENING TESTS 1. OGTT 2. Fasting/random glucose 3. HbA1C ²	SCREENING TESTS 1. OGTT 2. HbA1C 3. Fasting/random glucose
<i>Management of posttransplantation hyperglycemia</i> <ul style="list-style-type: none"> • Day 0-7: insulin • Day 8-45: insulin, oral anti-hyperglycemic agents 	<i>Management of Posttransplantation Diabetes Mellitus (PTDM)</i> <ul style="list-style-type: none"> • Lifestyle modification • Oral anti-hyperglycemic agents • Insulin 	

Risk Factors

Non-modifiable	Potentially modifiable	Modifiable ⁴	End-organ specific diagnosis
<p>African American, Hispanic</p> <p>Age > 45 years</p> <p>Male recipient</p> <p>Family history of diabetes mellitus</p> <p>Human Leukocyte Antigen (HLA) mismatches</p> <p>HLA A30, B27, B42</p> <p>Acute rejection history</p> <p>Deceased donor</p> <p>Male donor</p> <p>Genetic polymorphism (e.g. TCF7L2 rs7903146, PPAR-α rs4253728)</p>	<p>Hepatitis C virus¹</p> <p>Cytomegalovirus²</p> <p>Pretransplant IGT/IFG</p> <p>Proteinuria</p> <p>Hypomagnesemia³</p>	<p>Obesity (body mass index ≥ 30)</p> <p>LDL cholesterol</p> <p>Steroids, tacrolimus, cyclosporine, sirolimus</p> <p>Vitamin D deficiency</p>	<p>End stage kidney disease due to polycystic kidney disease</p> <p>End stage liver disease due to HCV infection or non-alcoholic steatohepatitis (NASH)</p> <p>End stage lung disease due to cystic fibrosis</p>

TRIALS/META ANALYSIS

- 2004 meta-analysis showed PTDM in 9.8% with tac vs CsA (DIRECT study).
- In ELITE study at one year higher rates of PTDM in low dose tacrolimus (8.4%) compared to std. dose of CSA(6%), low dose CSA (4.2 %) and low dose sirolimus.
- Recent meta-analysis of 56 randomized controlled trials demonstrated less PTDM and better overall graft survival with CNJ minimisation strategies using new agents such as belatacept or tofacitinib.

IMMUNOSUPPRESSANTS -PTDM

Cyclosporine vs tacrolimus

- Tacrolimus 2-3 times more diabetogenic.
- Marked beta cell toxicity , calcineurin inhibition, insulin hyposecretion.
- Trough level > 15 ng/ml first month high risk for PTDM.
- PTDM incidence with CNIs: **10–25%** in 36 months post-transplant.

Prednisone

- >10mg/day dose -- **1.8 fold** increased risk (increases with further increase in dose).
- **5 percent per 0.01 mg/kg per day increase** in prednisolone dose - PTDM risk increases.

ADJUSTING IMMUNOSUPPRESSION

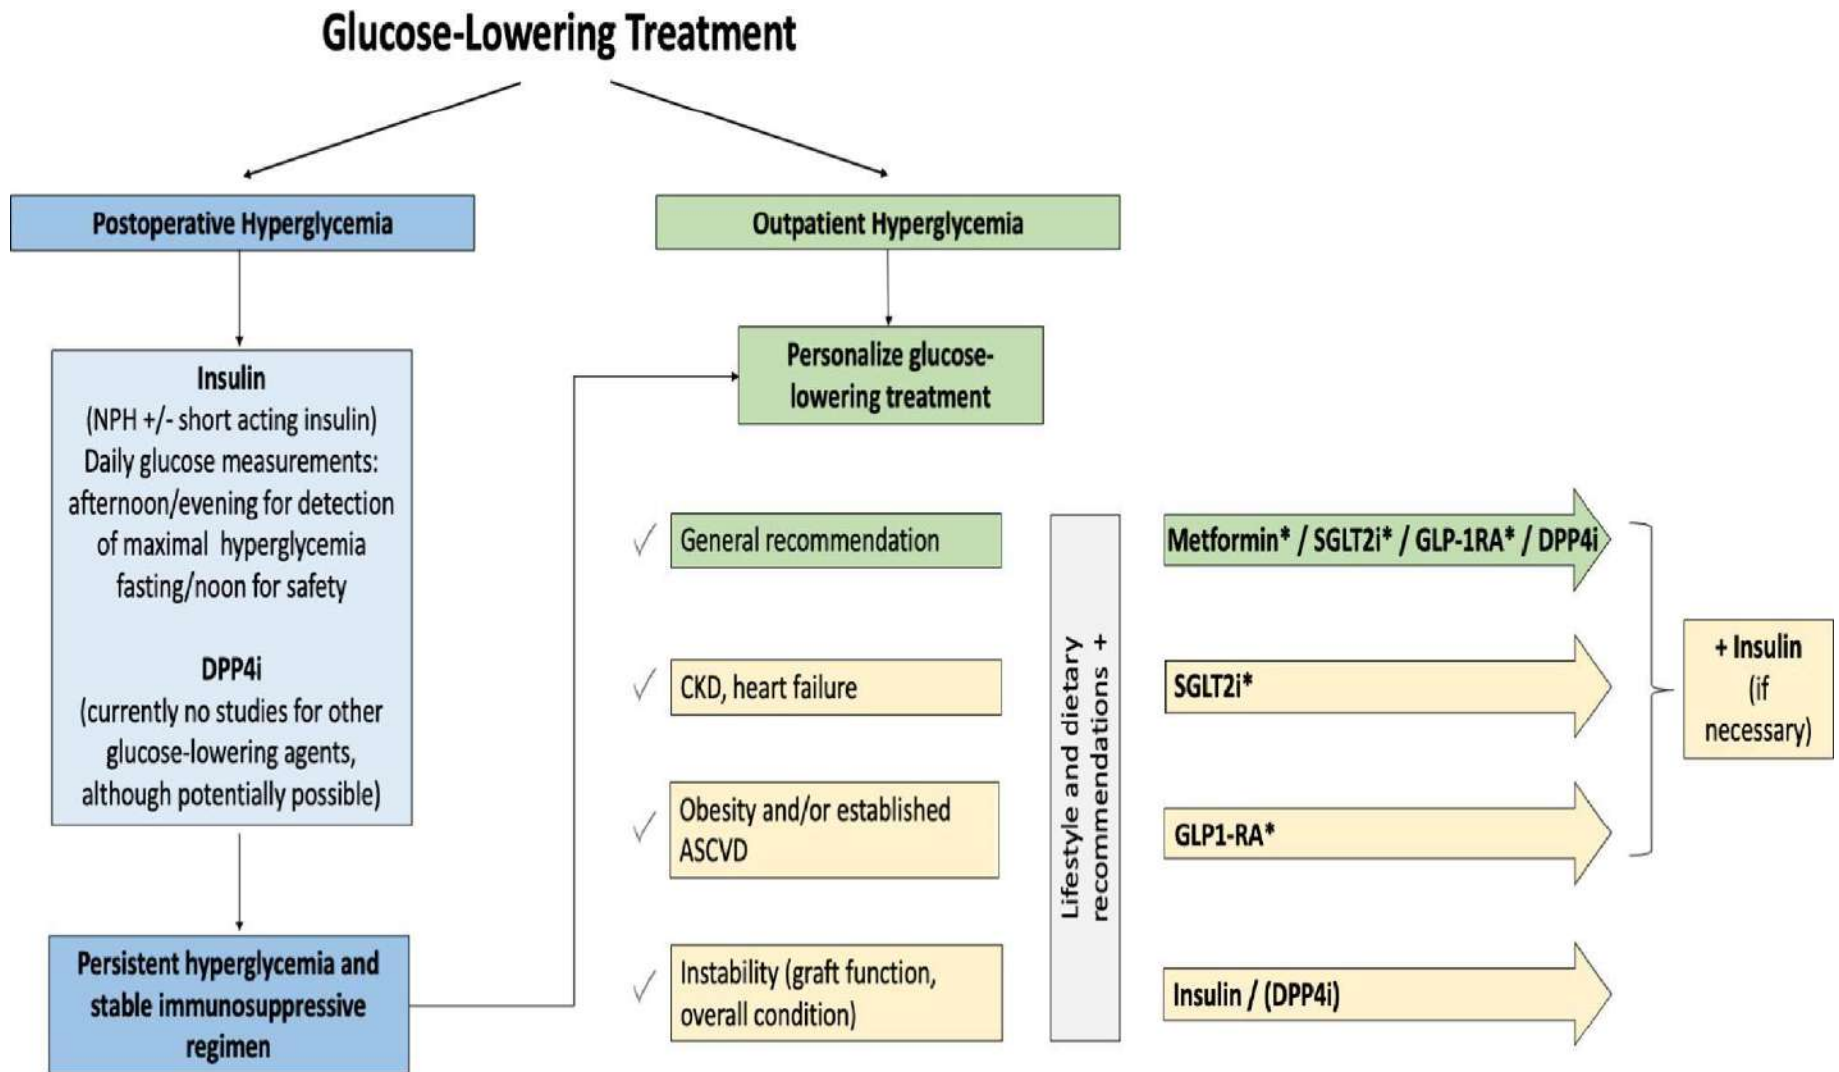

Steroids

- Steroid minimisation as early as possible.
- Prednisolone dose reduction to **5 mg** at **one year** (PTDM from 55 to 34%).
- Few study have found that there is no significant difference between 5mg prednisolone compared to complete steroid withdrawal at 5 years posttransplant (CSWD 22.5% vs. CCS 21.5%).
- No controlled data on the effect of late withdrawal of low dose steroids in patients with established PTDM.

• CNI

- Dose reduction without increasing risk for rejection.
- Change from tacro to Cyclosporin for PTDM is not recommended
- Effect of tacrolimus on glucose may be reversible even if agent is not discontinued
- Conversion to sirolimus may worsen insulin resistance, not recommended

Glucose-lowering treatment in KTRs: suggested algorithm

*Standard 'sick day' rules apply: advise patients to temporarily stop therapy in acute intercurrent illness until medical consult
